

Automated Feedback Analysis Workflow

Matthew Smith

Project Description

This project automates the analysis of customer feedback collected through Google Forms. When a new response is submitted, the system uses AI to generate a sentiment classification and a concise summary of the feedback. The results are then parsed and automatically written back to the corresponding row in Google Sheets. This ensures each submission is analyzed in real time and updated accurately, eliminating manual review while improving efficiency and response tracking and response alerts.

test date: 2-16-26

Results

Data Results

- Nearly **half of responses (45%) were negative**
- Positive feedback highlights:
 - Ease of use
 - Professional experience
 - Helpful support
- Negative feedback commonly mentions:
 - Product not working as advertised
 - Slow support response
 - Poor value for price
 - System glitches & unclear instructions

Sentiment breakdown

Positive: 3 (33%)

- Very Satisfied (1)
- Satisfied (2)

Neutral: 2 (22%)

Negative: 4 (45%)

- Unsatisfied (2)
- Very Unsatisfied (2)

Summaries

Positive Example:

“Customer had a smooth and professional experience, found the service easy to use, and would recommend it.”

Neutral Example:

“Mixed experience — some features worked well, but overall performance was average with room for improvement.”

Negative Example:

“Customer frustrated due to product performance issues, unclear instructions, and delayed support.”

Challenges & improvements

At the beginning of this project, I faced challenges with correctly updating the right row in Google Sheets for each form submission. There were issues with filter configuration, row matching, and understanding how data flowed between modules. At times, the Search Rows step returned zero results, and updates were not going to the intended row. Troubleshooting dynamic field mapping and exact text matching required careful testing and adjustment.

After identifying that the main issue was unreliable row matching and filter setup, I refined the workflow configuration. Once corrected, the system ran smoothly from start to finish. Feedback submissions were automatically analyzed by AI, sentiment and summaries were generated instantly, and the results were written back into Google Sheets. Negative feedback was successfully filtered and sent as an email alert. The automation significantly reduced manual work and improved efficiency.

With more time and tools, I would enhance the system by using stronger error handling, add a suggestion prompt to the questionnaire such like ("Please give one suggestion that would better your experience", use suggestion data in combination with AI to develop ideas for things like loyalty programs, promotions, etc., refine the alert system so high-severity issues trigger notifications and then a response feedback from agent or AI Agent.,
